# IEEE Std 1364-2001 Extended VCD (EVCD) Demo

Extended VCD files generated with `$dumpports` record port directionality and driver source strengths in addition to logic values.

This example renders `sample_ports.evcd` showing:

- Input port signals driven by test fixture (`req_in`).
- Output port signals driven by the Device Under Test (`ack_out`).
- Bidirectional 4-bit port (`data_io [3:0]`).

### EVCD Port Activity & Directionality ($dumpports)
